1. Project Overview

This project was completed as part of the Certified Ethical Hacker (CEH) cybersecurity course at Skillogic. The practical work demonstrates a Security Operations Center (SOC) workflow using Wazuh to monitor a Windows endpoint, identify security events, investigate authentication failures, review vulnerabilities, and document the results.

2. Project Objectives

- Configure and use Wazuh for endpoint security monitoring.
- Collect and analyze Windows Security events.
- Detect repeated failed authentication attempts.
- Investigate whether a successful authentication followed the detected failures.
- Review vulnerability findings and document remediation.
- Demonstrate File Integrity Monitoring and Security Configuration Assessment.
- Follow the SOC lifecycle from data collection through reporting.

4. Tools & Technologies

Wazuh; Wazuh Agent; Windows 11 Home Single Language; Windows Security Event Logs; Vulnerability Detection; File Integrity Monitoring (FIM); Security Configuration Assessment (SCA); MITRE ATT&CK.

5. Lab Environment

Agent: 004 – Rachamalla

Operating System: Microsoft Windows 11 Home Single Language

Wazuh Agent Version: 4.14.7

Agent Status: Active

The monitored endpoint was used as the controlled Windows security-test system.

6. SOC Workflow

Data Collection → Monitoring → Detection → Triage → Investigation → Response → Reporting

7. Vulnerability Detection & Remediation

ASP.NET Core: updated to 8.0.29 – Remediated.

WinRAR: updated from 6.21 to 7.23 – Remediated.

Oracle VirtualBox: updated from 7.0.8 to 7.2.16 – Remediated.

Advanced IP Scanner 2.5.4594.1 – Removed.

WhatsApp was investigated as a version-identification/mapping finding. Windows AppX metadata reported version 2.2632.100.0, while the WhatsApp application reported version 2.3000.1046156219.263200. The Microsoft Store reported no available upgrade. The application was therefore retained and documented as a version-identification/mapping finding rather than artificially removed.

McAfee WebAdvisor was likewise retained as an investigated version-identification/mapping finding where the package/component version differed from the vulnerability mapping.

8. File Integrity Monitoring

The project captured the Wazuh File Integrity Monitoring dashboard, integrity events, and registry deletion details. These screenshots demonstrate monitoring of integrity-related activity on the Windows endpoint.

9. Security Configuration Assessment

The project captured the Wazuh Configuration Assessment dashboard, assessment events, and CIS failed-check details. These artifacts demonstrate security configuration and compliance-oriented assessment of the endpoint.

10. Brute-Force Detection

Windows Security Event ID: 4625

Wazuh Rule 60122: Logon Failure - Unknown user or bad password

Wazuh Rule 60204: Multiple Windows Logon Failures

Rule Level: 10

MITRE ATT&CK: T1110 – Brute Force / Credential Access

The controlled test produced sequential failed network logons for WazuhTestUser1 through WazuhTestUser8. The latest PowerShell extraction showed the attempts between 13:50:35 and 13:51:07 on 27-Aug-2026. The attempts used Logon Type 3 and originated from 127.0.0.1. The detailed authentication event showed NTLM.

11. Investigation

The failed authentication activity was intentionally generated to validate SOC detection. Windows Event ID 4625 confirmed failed network authentication attempts.

The Wazuh search:

data.win.system.eventID:4624 AND data.win.eventdata.targetUserName:WazuhTestUser

returned no matching successful login in the checked period.

The activity was therefore classified as a true-positive detection of the tested behavior, but benign/authorized activity with no confirmed compromise.

12. Response

The alert was acknowledged, investigated, and validated as an authorized security test. No account disabling, IP blocking, endpoint isolation, firewall modification, or malware remediation was required.

Post-test SMB verification showed no active SMB session and no open SMB files. TCP port 445 was listening under PID 4 (System), while LanmanServer and LanmanWorkstation were running. This did not establish an ongoing SMB session.

13. Results & Findings

The practical exercise successfully demonstrated that Wazuh can collect Windows authentication events, identify repeated failures, escalate the activity to a higher-severity alert, support investigation of successful authentication, and provide evidence for a documented response decision.

The controlled brute-force behavior was detected as intended. No successful authentication for the test account was identified, so there was no evidence of compromise.

14. Incident Closure

Status: CLOSED – Benign/Authorized Security Test.

Conclusion: The Wazuh SOC implementation successfully demonstrated endpoint data collection, monitoring, detection, triage, investigation, response decision-making, vulnerability visibility, and reporting in a controlled cybersecurity training environment.

15. Future Scope

Future enhancements can include additional custom detection rules, automated response playbooks, centralized dashboards for multiple endpoints, richer correlation across authentication and network telemetry, and integration with additional SOC tooling.

16. References

- Wazuh project evidence and screenshots supplied for this CEH practical project.
- Supplied SOC project flow and incident-report material.
- Microsoft Windows Security event information referenced during the practical investigation.

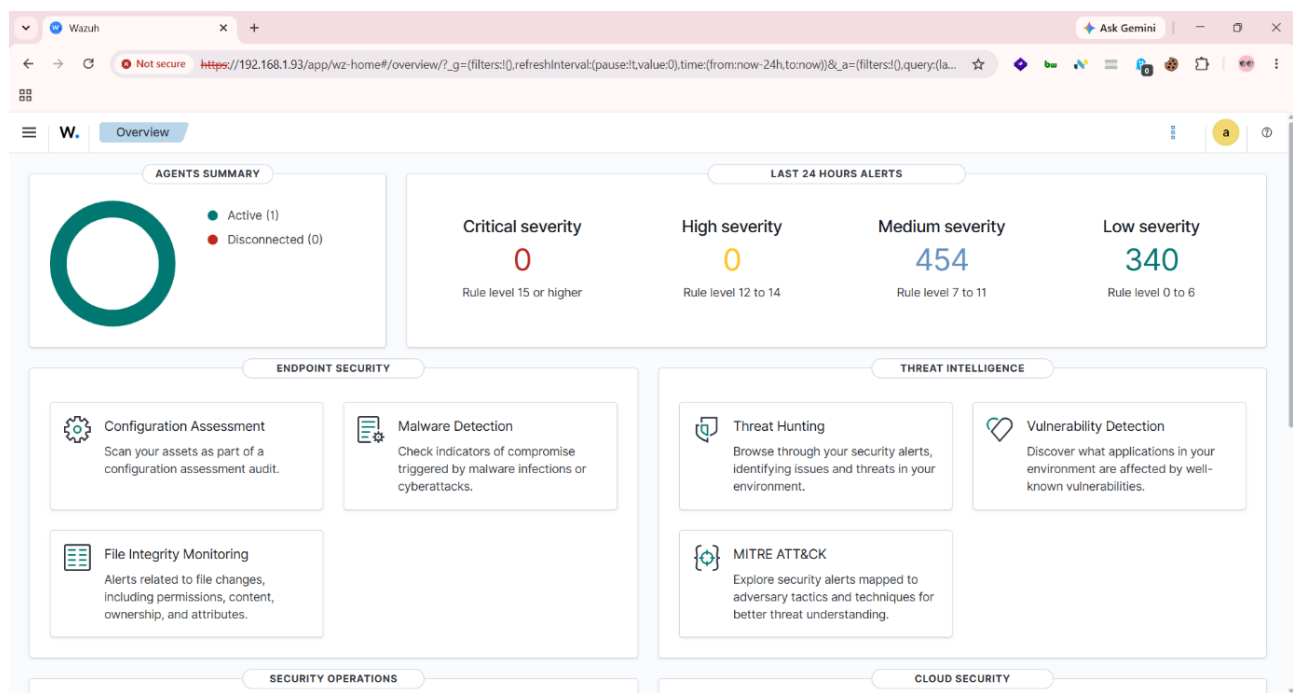

16. Incident Summary

Field	Result
Institute	Skillogic
Course	Certified Ethical Hacker (CEH)
Project	SOC Incident Detection & Vulnerability Investigation
Agent	004 – Rachamalla
Detection	Windows Event ID 4625

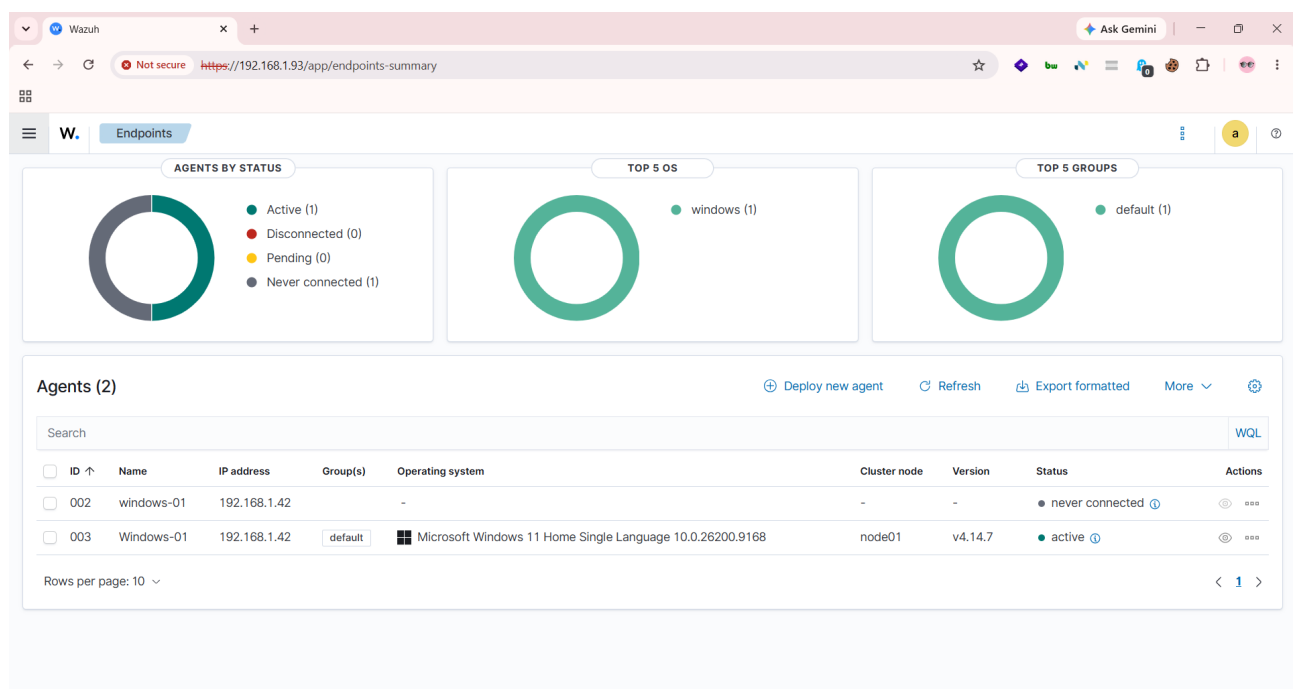

Field	Result
Escalation	Wazuh Rule 60204 – Level 10
MITRE ATT&CK	T1110 – Brute Force
Successful authentication	Not found for WazuhTestUser in checked 4624 search
Classification	True positive detection; benign/authorized test
Status	CLOSED – Benign/Authorized Security Test
